Honeycomb Prototype V1: Step-by-Step Guides

Team A17, CS 3803-DCA, Fall 2026

Honeycomb is a free web app for Georgia Tech undergraduates. It imports Canvas deadlines and Google Calendar, takes quick entries for everything else, and ranks it all into one “Do this next” card. This prototype uses sample data, so do not enter real links or passwords. Log in with the details already filled in.

Prototype link: https://jays-hub.github.io/honeycomb-v1/

The link opens a Prototype menu. Start each scenario from there. Each scenario loads its own sample data. **Switch scenario** in the top banner returns to the menu, and **Reset demo** starts the scenario over.

Scenario 1: Tonight’s deadlines

Heavy course load. Covers quick-add, the “Do this next” card and skipping.

It is 7:00 PM on Sunday, Nov 8. You have several deadlines tonight and may not finish them all, so you want to protect your grades. You just remembered a HIST 2111 Reading Quiz that is not in the app yet. It is due tonight at 9:00 PM, should take about 45 minutes, and is worth 3% of your course grade.

Get the quiz into Honeycomb, then work out what to start first and why. You also want to know how long the task after it should take, and which task would cost you the least if you run out of time. Now suppose you finish that first task. You aren’t up for the next one, so put it off and see what Honeycomb suggests instead.

Step by step

1. On the Prototype menu, choose **Start Scenario 1**.
2. On the Log in screen, leave the details as filled in and choose **Log in or create account**. Home opens.
3. Choose **Add task**. In **Title**, type HIST 2111 Reading Quiz. Leave **Cell** set to Classes.
4. Open **More details**. Under Due date, choose **Tonight**, then set **Time** to 9:00 PM.
5. In **Expected time**, type 45m. In **% of course grade**, type 3. Choose **Save task**.
6. Read the **Do this next** card, which now shows HIST 2111 Reading Quiz. Choose **Why this first** to see the reason, then **Back to Home**.
7. In the **This week** list, find the second task, PHYS 2212 Lab Report 7, and read its Expected time.
8. Scroll to **Won’t fit in time**. The task there is the one that would cost you the least.
9. On the card, choose **Mark done**.
10. On the card, choose **Not now**, and see what the card shows next.

Expected result: Before the quiz, tonight’s 4h 30m of work fits in the 4h 59m left. After it, the list shows 5h 15m of work against 4h 59m left, and ECON 2100 Discussion Post (1%) drops under “Won’t fit in time.” The quiz moves to the top with 1h 15m to spare. PHYS 2212 Lab Report 7 is next, at 2h 15m. Marking the quiz done moves the clock to 7:45 PM and brings up the lab report. Choosing Not now brings up CS 1332 Homework 6, and the lab report stays in the list marked “Skipped.”

How the prototype does this: The ranking runs live in the browser on sample tasks. The demo clock starts at 7:00 PM, and marking a task done moves it ahead by that task’s expected time.

Scenario 2: First-time setup and a wrong date

First-year student. Covers import and editing a due date.

It is Sunday, Nov 8. You are a first-year student opening Honeycomb for the first time. Your classes are in Google Calendar, your deadlines are in Canvas, and you do not want to type assignments in by hand.

Get your classes and deadlines into Honeycomb using the sample data provided. Your instructor just moved MATH 1554 Homework 9 to Friday, Nov 13 at 11:59 PM, but Canvas still shows Wednesday, Nov 11. Fix this in Honeycomb and see how it affects your priorities.

Step by step

1. On the Prototype menu, choose **Start Scenario 2**.
2. On the Log in screen, leave the details as filled in and choose **Log in or create account**. Connect your calendars opens.
3. Under Canvas, choose **Use sample link**, then **Connect Canvas**.
4. Under Google Calendar, choose **Connect Google Calendar**, then **Allow**.
5. Choose **Go to Home**. Find MATH 1554 Homework 9 in the ranked list.
6. Choose the title **MATH 1554 Homework 9**. Edit task opens.
7. Under Due date, change **Day** to Fri, Nov 13. Leave **Time** at 11:59 PM. Choose **Save task**.
8. On Home, find the homework again and check its new date and place in the list.

Expected result: Imported tasks appear in one ranked list, tagged “From Canvas,” with % of grade showing “Not set” until the student adds one. The homework shows the new date, marked “Changed by you,” with “Restore Canvas date.” It moves from second to fourth. To see the error handling, before step 3 type anything in **Canvas calendar feed link** and choose **Connect Canvas**: a red error says how to fix it.

How the prototype does this: There is no real Canvas or Google connection. Use sample link fills in a sample feed link, and the Google permission step is simulated with sample classes.

Scenario 3: Balancing the week

Club member with a job. Covers the weekly view, cells with progress, and club and class work ranked together.

It is 7:00 PM on Sunday, Nov 8. You are in the robotics club and work shifts at the campus recreation center. You want to see where your whole week stands, including everything outside of class.

Find out when your next work shift is, what Honeycomb thinks you should do next, and why. See how far along your Clubs tasks are. You also need to book a room for the robotics meeting but have no details yet, so record it under Clubs as “Book room for robotics meeting.” You just ordered the motor parts, so update Honeycomb and see where Clubs stands now.

Step by step

1. On the Prototype menu, choose **Start Scenario 3**.
2. On the Log in screen, leave the details as filled in and choose **Log in or create account**. Home opens.
3. In the main navigation, choose **Week**. Under Mon, Nov 9, find the work shift.
4. Choose **Home**. Read the **Do this next** card, then choose **Why this first** to see the reason.
5. Choose **Cells** and read the count on Clubs.
6. Choose **Home**, then **Add task**. In **Title**, type Book room for robotics meeting. Set **Cell** to Clubs. Leave **More details** closed and choose **Save task**.
7. On Home, find the new task under **No due date**. Choose **Cells** and read the Clubs count again.
8. Choose **Home**. With Order motor parts on the card, choose **Mark done**.
9. Choose **Cells** and read the Clubs count once more.

Expected result: The week shows tasks and fixed blocks by day, starting Sunday, with Next week and Week after tabs. The next work shift is Mon, Nov 9, 2:00 PM to 6:00 PM, at the Campus Recreation Center. The card shows “Order motor parts” from Clubs ahead of a class task, because it has less spare time. The new task lands in Clubs under “No due date.” The Clubs count reads 2 of 4 done, then 2 of 5, then 3 of 5.

How the prototype does this: The scenario loads sample tasks and fixed blocks such as classes and work shifts. School, club, job and personal tasks share one ranking, and a task with no due date stays out of it until it gets one.
